STATEWIDE IMMUNIZATION INFORMATION SYSTEM: Business Plan: Draft 5

I. Executive Summary

Background

Immunizing populations against infectious diseases is among the most cost-effective public health interventions. Currently, 13 infectious diseases can be prevented by the timely immunization of high-risk individuals. Despite efforts of healthcare providers and organizations, however, the United States (New Mexico, in particular) is unable to attain sufficiently high immunization levels to reliably prevent infectious diseases in our communities.

Numerous studies conclude that the single most effective mechanism to attain New Mexico's immunization objectives is to develop a Statewide Immunization Information System (SIIS). New Mexico offers a unique setting to test and evaluate public health models and demonstration projects. It is a large state, and its small population is distributed primarily throughout rural and frontier regions. Over one-third of the state's total population lives in one metropolitan area. In addition, New Mexico's population is among the most ethnically and racially diverse of any state in the country. And, the state shares an international border with Mexico.

In this Business Plan, a group of partners, including private and public healthcare providers and the New Mexico Department of Health (NMDOH), propose a collaboration of established healthcare partners to implement and evaluate an SIIS using advanced, distributed database technology. The healthcare partners include the two dominant managed-care organizations in New Mexico; the single, academic medical center; the U.S. Indian Health Service; a regional network of primary-care clinics; and the NMDOH, with 50 public health clinics throughout the state. The technical partner is the Advanced Computing Laboratory of Los Alamos National Laboratory (LANL), which has developed and implemented data systems in a high-security environment over the Internet. This collaboration builds upon a series of strong, productive partnerships focusing on sharing health data and developing a public health information infrastructure in New Mexico.

Positive Attributes of an SIIS

An SIIS collaboration offers a number of appealing features such as:

- A single, statewide public health infrastructure—*the NMDOH*,
- An established partnership with a world-class, vendor-neutral technological resource—*LANL*,
- Preexisting, highly productive collaborations with participating organizations,
- Advanced, distributed database technology utilizing a Master Patient Index, allowing secure, encrypted transactions over the Internet—*TeleMed*,

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

- A fully funded, ongoing immunization information system pilot project utilizing TeleMed technology—the *Northern New Mexico Rural Telemedicine Project (NNMRTP)*, and
- A partnership with New Mexico's Professional Standards Review and Peer Review Organization to facilitate evaluating and analyzing the public health impact of the proposed SIIS—the *New Mexico Medical Review Association*.

Proposed Functionality of an SIIS

Developing an SIIS is technically and operationally challenging. National experience shows that the most effective systems are developed at local levels, with input from healthcare providers that actually will use the system.

To this end, an ongoing, broad-based collaborative group of healthcare providers and stakeholders in New Mexico has met and crafted functional characteristics of an SIIS that are consistent with national registry guidelines. The SIIS would:

- Enroll a person at birth or when the person receives healthcare—the “cradle-to-grave” concept;
- Establish a core data set, including unique individual identifiers;
- Have privacy and confidentiality protections and security mechanisms;
- Allow timely data collecting and editing by provider systems;
- Eliminate duplicate records;
- Eliminate multiple data entries;
- Provide quality assurance (QA) and data integrity components;
- Enable rapid and interactive access for all approved providers and SIIS users;
- Offer flexibility and ease of use;
- Have a rules-based logic system for predicting point-of-service immunization requirements;
- Provide simplified electronic Vaccines for Children (VFC) documentation;
- Have a capacity for site-specific reporting and analysis;
- Offer appropriate access to complete immunization records for 80% of all people vaccinated in New Mexico;
- Link existing provider database systems;
- Have the capacity to aggregate data statewide for analyses and reporting;
- Provide information to improve vaccine-inventory management;
- Have the capacity for more accurate and timely reporting of immunization information, including adverse reactions;
- Design a process drive by a provider/user interface;
- Offer Geographic Information System capabilities (to relate immunization coverage to the incidence of vaccine preventable infectious diseases), and
- Enable on-line access to relevant medical literature and information regarding immunization administration.

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

Partnerships

The collaboration is among the NMDOH, LANL, and such established healthcare partners as:

- the American Academy of Family Physicians, N. M. Chapter,
- the American College of Physicians, N. M. Chapter,
- BlueCross BlueShield of New Mexico,
- Cimarron Managed Care Corp.—the University of New Mexico,
- the Infectious Diseases Society of America, N. M. Chapter,
- Lovelace Health Systems,
- the New Mexico Medical Society,
- the New Mexico Pediatric Society,
- the New Mexico Primary Care Association,
- Presbyterian Healthcare Services,
- St. Joseph Healthcare,
- the U.S. Indian Health Service, and
- the University of New Mexico Health Sciences Center.

II. SIIS Concept

The TeleMed Solution—A Brief Description

Working to find high-performance computing solutions to today's complex problems, LANL has spent the last five years—initially in conjunction with the National Jewish Center for Immunology and Respiratory Medicine—developing a cross-platform, secure technology for medical information-sharing over the Internet.

The resulting technology is called TeleMed, (see: <http://www.acl.lanl.gov/TeleMed>). It is being transferred to the public/private sector, where it will enable medical record and data sharing across multiple platforms and software solutions to serve as a model for national data sharing in a high-security environment via the Internet.

The actual data that TeleMed retrieves is only a “snapshot” of a patient's medical information residing at different locations and healthcare provider offices. Because TeleMed is based on distributed database technology. Actual patient data remains in the possession and under the protection of the organization that generated it.

The end result will be a system unique in terms of a standardized immunization registry with national and international applicability. The TeleMed/SIIS project also can expand into other important public health areas, such as disease management, outbreak reporting, and surveillance.

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

Project Overview

The Public Health Division (PHD) of the NMDOH proposes to partner with LANL and several large healthcare providers in New Mexico to link existing immunization information from all project partners and make it available as a complete immunization record system. The SIIS would offer both individual and aggregate reporting of information through a common TeleMed interface. Planning efforts have begun for an enhanced SIIS with this additional functionality.

The State of New Mexico recognizes the need for a repository of immunization records for analysis and reporting, as well as retaining historical records that healthcare providers outside the PHD may otherwise archive—possibly rendering the data unavailable.

The SIIS will be able to create a real-time electronic immunization record (derived through TeleMed technology) to give public and private sector partners access to a medical patient's full immunization record regardless of the site(s) where the information resides.

The system will give major healthcare providers up-to-date immunization information that should minimize over- or under-immunizing and missed opportunities for administering vaccines. Through negotiated agreements among partners and in parallel with national immunization registry objectives, SIIS would offer numerous benefits and efficiencies. (See Executive Summary, Proposed Functionality of an SIIS for details.)

Standards Compliance: The development and implementation of the SIIS will follow standards from the Object Management Group's (OMG) Common Object Request Broker Architecture (also known as CORBAmed) standards for constructing a Patient Identification System (PIDS) and collecting basic immunization information. (CORBA is an international group having widely recognized and accepted standards.) The distributed capabilities of the TeleMed and CORBA technology will enable individual clinical sites to make their immunization information accessible statewide.

Data Access: At the state level, the PHD will aggregate information from the distributed sites with mechanisms for ensuring data integrity (i.e., marking data as copies). In other others, the PHD will maintain a repository of information—a "mirror" archival site, with copies of all statewide immunization data. This repository will provide the following two useful functions:

- (1) The state will be able to sustain a long-term archival of information, which is one of the charges of the NMDOH.
- (2) The repository will be a general access point for immunization information. An approved healthcare or managed-care provider or other SIIS user can query the repository for immunization information.

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

Confidentiality and Security: Confidentiality will be managed for authenticating and authorizing individuals with access to the system using small cryptographic hardware technology (e.g., SmartCards, iButton, etc.). SmartCard technology is approved by the military and national defense laboratories to ensure secure information and authorize user access.

Communications Technology: The infrastructure required for the SIIS includes existing Internet/intranet connections. Combined with TeleMed technology, the infrastructure is more than adequate for implementing a secure SIIS. It meets the needs of a statewide immunization registry and establishes a structure able to expand far beyond immunization issues. The design of the system will also enable statistical reporting and analyses independent of knowing the identity of individual patients/clients. This feature should greatly facilitate the state's reporting requirements to the CDC.

Target Population

Building on the PHD's infrastructure-development efforts and current statewide

Systems, Presbyterian Healthcare Systems, BlueCross BlueShield of New Mexico, the Cimarron Managed Care Corp. and the University of New Mexico Health Sciences Center (UNMHSC), and the U.S. Indian Health Services (IHS)—the PHD proposes joining the existing immunization information of all project partners and make it available as a complete immunization record system offering both individual and aggregate reporting information through a common TeleMed interface. The PHD estimates these partners immunize 80% of all the people given vaccines in New Mexico.

Most importantly, instant statewide access to an immunization information system, populated by New Mexico birth cohorts, would allow healthcare providers (in walk-in clinics, urgent care centers, emergency rooms, etc.) to reach poorly served populations to minimize "missed opportunities" to provide immunizations.

Included in the PHD are three important working units that will also contribute to this effort:

- Immunization Program—has statewide staffing for facilitating the immunization of children. New Mexico is among the few states providing vaccines universally without cost to any child from birth to 18 years old through the Vaccines for Children (VFC) program and other federal and state funding. The NMDOH refers to this program as the VFC program. (See Appendix for additional information on the VFC program.)
- New Mexico Vital Records and Health Statistics—has data from birth records that will be used to populate the SIIS. Currently, 96% of all birth records are reported electronically from hospitals to the state's Vital Records.

STATEWIDE IMMUNIZATION INFORMATION SYSTEM: Business Plan: Draft 5

- PHD's Border Health Office—has information about immunized people who live in N.M. counties bordering Mexico. This will be especially important in analyzing immunization information to see if rates can increase and vaccine-preventable diseases decrease in the counties.

III. SIIS Goals

Numerous goals for the SIIS include:

- advancing an already-proven technology,
- using TeleMed to expand the SIIS to the private sector,
- having patient identifiers as the key to integration,
- offering a Master Patient Index within the PIDS,
- utilizing minimal system requirements,
- creating effective systems for organizational support,
- providing ongoing education and training based on existing partnerships,
- enhancing collaborative distance-learning in New Mexico,
- promoting the use of public health information systems,
- integrating existing public health information systems within the SIIS,
- linking private and public healthcare systems, and
- creating a sustainable resource.

Advancing a Proven Technology

TeleMed technology was designed to manage important components of a longitudinal patient record for management of chronically ill patients, specifically multi-drug-resistant TB in conjunction with the National Jewish Center for Immunology and Respiratory Disease.

Expanding the SIIS to the Private Sector via TeleMed

One of the key efforts in this SIIS project is interfacing with the various systems used by collaborative partners and appropriately augmenting their capabilities. The general plan for enhancing the system, greatly expanding the existing infrastructure at all partner sites, is to provide “generic” interface mechanisms for each collaborative partner to customize to match their internal systems and plans for using the SIIS via TeleMed.

Finally, security is crucial to the success of any medical-information system. SIIS data will only be accessible to people having proper credentials and assigned a unique security devise for confidential and proprietary data. Two systems are currently under consideration: the SmartCard and iButton.

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

Patient Identifiers Key to Integration

The real “glue” of the TeleMed/SIIS will be the ability to appropriately identify patients/clients between disparate providers’ systems because the clients will have different identification, depending on the system tracking them. This is a commercial reality.

Master Patient Index within the PIDS

As mentioned previously, patients are frequently identified in different ways by different programs/organizations within a system. Rather than having to “gut” a system by starting all over and identifying clients using a single, common identifier, medical institutions have long used a Master Patient Index (MPI) to correlate and integrate patient information.

Minimal System Requirements

Distributing MPI software and using it will occur via telephone systems (through Internet Service Providers) and direct connection via point-to-point or frame-relay services. Minimal hardware requirements for the SIIS are a personal computer (a 486 or better), a data modem, Web-browsing software, and an Internet Service Provider account. An Internet-based data server may be required for locations where the provider/user is required to maintain the local, Web-enabled database that would be accessible by the MPI.

Creating Effective Organizational-Support Systems

Few systems have such a great ability to improve quality/connectivity, while reducing administrative and maintenance burdens as distributed Internet-based virtual systems. The strength of the SIIS is its ease of use, unlimited connectivity to daily activities occurring in immunizations, and elimination of many problems for information-supplying organizations and the NMDOH, which must receive outside information and manually enter it, or verify (and frequently reject) data formats before uploading into the state’s database.

Some notable outcomes of implementing the SIIS would include:

- less data entry,
- more accurate records,
- increased reporting compliance,
- fewer missed opportunities for immunizations, and
- system edits to reduce duplication of records.

Ongoing Education and Training Based on Existing Partnerships

VFC-provider clinics are visited yearly by NMDOH staff as part of the Immunization Program’s quality control. During visits, immunization and SIIS educational materials are provided and VFC-provider staff are invited to participate in Centers of Disease Control and Prevention (CDC) sponsored satellite down-link courses, such as the Vaccine

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

Preventable Disease, Hepatitis C, and Surveillance courses. Regular communication with VFC providers includes providing any new CDC/Department of Health immunization pamphlets, posters, and policies on vaccine administration (based on ACIP guidelines, Vaccine Information Statements, etc.).

Meetings of the New Mexico Childhood Immunization Coalition provide another forum for education and training for immunization providers. Most of the TeleMed/SIIS project partners and members of the TeleMed/SIIS Medical Advisory Group belong to the Immunization Working Group of the above-mentioned coalition. Education, updates, and training on the TeleMed/SIIS are among the group's planned activities.

Collaborative Distance-Learning in New Mexico

A preexisting collaboration (which can be a model for continued education and training with the PHD and among partner organizations) involves a partnership with the UNM Media Technologies and the Electronic Distance Education Network distance-learning satellite network. The collaboration involves the NMDOH, the UNMHSC, Presbyterian Healthcare Systems, Lovelace Health Systems, IHS, and Sandia National Laboratories in cooperation with the New Mexico Medical Society and the New Mexico Dental Association.

Linking Private and Public Healthcare Systems

Implementing successful community-based systems is at the heart of all TeleMed applications because of its distributed nature. It means that partners in efforts like the NNM RTP and the SIIS are active participants in the systems with which they connect. This active participation requires committing to maintaining and entering data at each participating site as the first assurance of success.

SIIS Objectives and Goals for New Mexico

The TeleMed/SIIS project involves the aggressive deployment and use of a cutting-edge technology to create the SIIS. This complex and technically challenging project is aimed at the goals and objectives in the areas of immunization, technical implementation, and project management. These are outlined in Table 1.

Table 1

| SIIS OBJECTIVES & GOALS FOR NEW MEXICO | | |
|--|------------|-------|
| | Objectives | Goals |

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

| | | |
|---------------------|---|---|
| Technical | <ul style="list-style-type: none"> • Increase provisions of immunization data to public & private care providers that is valid, accurate & timely via a virtual immunization record of patient being queried • Improve clinicians' ability to make accurate immunization decisions based on immunization guidelines • Achieve consistent use or data-uploading of immunization information by participant provider based on ease of access | <ul style="list-style-type: none"> • Demonstrate high-security information exchanges over Internet via a collection of distributed databases • Successfully implement TeleMed/SIIS across diverse set of public & private provider organizations • Ensure minimalist approach to required data-entry activities to lower potential conflicts of data entry vs. service |
| Immunization | <ul style="list-style-type: none"> • Achieve 90%-immunization rate for children by age of 2 • Increase immunizations by capitalizing on immunization opportunities • Provide appropriate immunizations to children, adolescents & adults • Improve immunization guidelines compliance by automatically assessing patient records according to latest guidelines • Raise number of children electronically entered at birth into the system | <ul style="list-style-type: none"> • Raise state immunizations via information infrastructure & support to better track, access, and report applicable information on people throughout state |

STATEWIDE IMMUNIZATION INFORMATION SYSTEM: Business Plan: Draft 5

- Use the SIIS to assess children's medical records & send immunization reminder and recall notices

IV. Managing the SIIS

Sustaining the TeleMed Virtual Network

The only area not covered by the distributed approach to database and systems maintenance is the actual software that sites use to interface with all partners in a virtual organization. Maintenance of the TeleMed part will have to occur separately. Initially, this support will be provided by LANL. Conceivably, the NMDOH will train internal staff in using and maintaining the system. Using commercial software that links into TeleMed (along with JAVA technology enabling automatic system updates through the remote distribution of applets) will allow remote troubleshooting and maintenance.

Because we are taking the technology developed in this project through the CORBAmed standardization process, we will also have the option of purchasing commercial versions of our software. These commercial sites would be another possibility for sustaining this technology. Specialized maintenance contracts with commercial companies that support TeleMed technologies are another possibility.

Before the specific approach can be set forth, project partners will complete quality assurance processes and gauge the scope of maintenance and troubleshooting activities. Based on technical-implementation evaluations that occur in the first two years of the project, the partners will draft a sustainability plan to be institutionalized by the end of the final third year of the project. A Letter of Intent to sustain the SIIS in New Mexico will follow.

STATEWIDE IMMUNIZATION INFORMATION SYSTEM: Business Plan: Draft 5

Project Management Goals and Objectives

There are numerous project management goals and objectives involved in the SIIS, which are outlined below.

| PROJECT MANAGEMENT | |
|---|---|
| GOALS | OBJECTIVES |
| <ul style="list-style-type: none">• Provide strong project direction & leadership through a NMDOH Program Team• Enable continual stakeholder input & collaborative technical troubleshooting via a medical advisory group and a technical work group• Assure frequent, clear & timely communication between partners• Assure adequate resources are allocated for the SIIS for each of 3 years & thereafter to sustain the SIIS• Assure problem resolution is addressed in a timely & satisfactory manner for all partners• Assure the evaluation of the project is thorough & ongoing | <ul style="list-style-type: none">• Assure development of a detailed work plan, with ongoing evaluation of plan• Assure the Project Work Plan and all other plans are thoroughly developed and adequately implemented according to schedule. These include plans for: interfaces, testing, pilots, training, access & security, implementation, help desk, evaluation, & maintenance• Monitor contracts associated with the SIIS, assuring contract deliverables are satisfactorily met according to the Scope of Work in each contract• Create sufficient technical expertise among participant organization to assure long-term maintenance of the system• Conduct regular team meetings to assess progress & address any pressing issues |

V. Developing the SIIS

A TeleMed Interface

The Northern New Mexico Rural Telemedicine Project (NNMRTP) is one of the National Telecommunication Information Act's testbed projects for medical records sharing over the Internet in a rural setting. Although focusing initially on immunization records, this collaborative effort is developing a very basic prototype electronic patient record.

STATEWIDE IMMUNIZATION INFORMATION SYSTEM: Business Plan: Draft 5

Using this technology with appropriate software developed for the clinics, a physician in Coyote, N. M., would (with appropriate authorization) connect via the Internet to a hospital 40 miles away in Española to access the medical record of any patient treated there and determine the problems identified, prescriptions made, and recommended treatments or scheduled revisits.

Initial goals of implementing a scaled-down version of TeleMed in the rural Northern New Mexico setting include:

- increased immunization rates,
- decreased abuse of controlled substance prescriptions,
- decreased instances of lost patient records, and
- decreased instances of multiple patient records.

The NNM RTP works with the desire to apply the TeleMed software technology to developing a distributed medical-information system for a rural community. The goal is to create an environment interconnecting various healthcare providers and enable appropriate healthcare, especially for patients moving from clinic to clinic to hospital. The idea is to build in stages a computerized patient-record system, by collaborating with local companies, to allow immediate, secure access to patient records simultaneously from multiple locations so that rural-care physicians can access more advanced medical technologies located at larger medical centers.

Although TeleMed's focus is regional, it is part of a larger effort that LANL is involved in—seeking to coordinate healthcare information systems on state and national scales. The regional component of this requires a coordinated effort between country and state agencies, local software companies, healthcare providers, and hardware and networking providers. Partners in the NNM RTP believe their demonstration of the electronic patient record should rapidly become a core component of almost every healthcare provider's operations, ensuring its sustainability as a useful technology.

Diversity among Prospective SIIS Users

A final component of successful community linkages is the involvement of a diverse set of users within the healthcare environment. Among the types of organizations that will use SIIS both immediately and in the future (Year 3 and beyond) are:

- public and private healthcare offices,
- emergency rooms and hospitals,
- border health organizations,
- EMS personnel,
- juvenile centers,
- jails and prisons,
- military facilities,

STATEWIDE IMMUNIZATION INFORMATION SYSTEM: Business Plan: Draft 5

- the PHD and the NMDOH,
- IHS,
- urgent care centers,
- long-term care facilities,
- home health services,
- veteran's center hospitals, and
- schools.

Future security requirements that for all prospective SIIS users (i.e., public and private healthcare entities) will be a minimal data set allowing a less cumbersome approach to individuals receiving and delivering services. A requirement for maximum utilization of the SIIS will be to ensure it provides on-demand, accurate immunization records for individuals receiving services, while creating a comprehensive project structure with detailed procedures and security mechanisms to guide all users.

Overcoming Barriers: Initial meetings with project partners identified barriers to implementation that must be addressed. Some barriers included:

- the public not wanting more of their personal information on-line,
- assuring the public of the security of the information being stored,
- perceptions by providers of more control and regulation over the practice of medicine,
- the costs of implementing this system,
- achieving timely and accurate data entry,
- clinicians' trust in electronic data vs. paper medical records,
- diversity of partner organization infrastructures,
- usual resistance to change, and
- the priority of data entry vs. service.

VI. Implementation Plan for Integration

Implementing the SIIS initially will call for creating links with:

- TeleMed,
- the NMDOH,
- IHS,
- Presbyterian,
- BlueCross BlueShield, and
- Lovelace.

In the course of this three-year project, the PHD and its partners will:

- develop specifications for interfacing with the TeleMed/SIIS,

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

- create an advanced Patient Identifier system (PIDS) connected to a Master Patient Index (MPI),
- specify equipment needs to deploy, purchase and install necessary equipment,
- test versions of the TeleMed/SIIS,
- pilot the SIIS,
- conduct training,
- deploy final versions of the SIIS using a phased approach,
- begin evaluations, and
- work to link in secondary partners such as
 - Albuquerque Public Schools,
 - the Border Health Office, and
 - collaborating organizations from El Paso/Juarez, Mexico, and Arizona /Utah Area IHS jurisdictions.

The SIIS will be phased in over 3 years, with specific steps to be accomplished during that time. Security is one of the single biggest issues in the SIIS. To monitor and ensure security throughout the implementation, the state intends to initially deploy the SIIS by creating a “mirror” copy of the PHD’s internal SIIS to serve as the SIIS central repository

with no current electronic immunization system in place, this will be a big step. The PHD will add multiple servers from other sites, again ensuring proper security measures are taken and interfacing is complete before information exchanges begin. The distributed architecture of TeleMed allows the state to take a phased, flexible approach that isn’t feasible for a fixed, central system.

STATEWIDE IMMUNIZATION INFORMATION SYSTEM: Business Plan: Draft 5

Table 2 outlines overall activities and the timeframe in which they are scheduled to occur.

| SIIS IMPLEMENTATION SCHEDULE | | |
|---|--|--|
| 1st Year | 2nd Year | 3rd Year |
| <ul style="list-style-type: none"> • Identify project coordinator • Appoint policy committee. Develop & execute policy-level agreements between partners on data access, standards, sharing, & confidentiality • ID technical experts in partner organizations • Develop interface & detailed implementation plans with each partner • Tailor TeleMed interface to SIIS specifications as determined by JAD • Develop equipment specifications for full system implementation • Assure Internet access at all participating sites • Publish required progress & annual financial reports • Develop long-term maintenance plan (it may involve implementing user fees, outsourcing maintenance or hiring staff to maintain the SIIS | <ul style="list-style-type: none"> • Implement training plan • Implement testing plan, testing initial SIIS from Santa Fe & 2 partner sites. Adjust as needed & finish testing • Complete user & technical documentation • Implement interface plans with each partner • Pilot system in 1 of each participating partner sites • Implement access & security plan • Phase in SIIS at partner sites • Develop evaluation plan • Publish required progress report & annual financial report | <ul style="list-style-type: none"> • Evaluate plan for long-term system maintenance • Finish implementation at partner sites • Focus on resolving problems • Expand capabilities to Arizona & Utah regions of Navajo Nation • Start talks at BHO on El Paso/Juarez & with IHS Navajo area sites. • Implement evaluation plan & evaluate success of SIIS • Start talks to bring SIIS in Albuquerque Public Schools • Publish required progress report & annual financial report |

Immunization Issues

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

Audits

Clinical Assessment Software Application (CASA) audits will be conducted initially in each clinic to determine a baseline immunization level for children aged 0 to 39 months.

The CASA audits will be repeated annually to determine there is an increase in immunization levels. While conducting each audit, the average age of first immunization, age-appropriate immunization rates, missed opportunities and average length between administration of each set of immunizations will be determined. This information indicates the success of immunization monitoring and recall efforts of each clinic and identify missed opportunities for immunization. Initially, CASA audits would be conducted manually. As providers are linked to the SIIS, the audits will be conducted electronically.

Surveys

As part of the vital records link and once two birth cohorts are included in the SIIS, a population-based survey of immunization rates of children aged 24 months will be conducted in Year 3. This survey will give a community-based look at the impact of the SIIS. Survey data will be compared to the 1996 and 1997 National Immunization Survey data for New Mexico to determine increases in immunization levels in this cohort. A component of this survey will include the identification of pockets of need by applying GIS methodology to the survey data. Once pockets of need are found, initiatives will be employed to provide the children and their families with a medical home so their health status, including immunization, will be improved. The population-based survey and GIS mapping will be primarily conducted electronically.

Monitoring

The SIIS will facilitate monitoring. For example, in those areas of the state where there have been Hepatitis A disease outbreaks involving children, the capacity of the SIIS for monitoring and tracking childhood immunization will increase immunization levels for Hepatitis A. Disease surveillance in these areas in Years 2 and 3 should show a marked decrease in the incidence of Hepatitis A disease trends, because of the low incidence, will not be obvious in a two- to three-year time span.

Technical Implementation

In Year 2 of the project, the partners will validate security and information exchanges over several sites, beginning first within the NMDOH and, then, including partner sites. These evaluations will be based on the:

- number of difficulties encountered in information transfers,
- success of compiling information from separate databases into a single record that can be accessed using the TeleMed interface, and
- attempts to “break in” to the system without the proper IP authorization.

STATEWIDE IMMUNIZATION INFORMATION SYSTEM: Business Plan: Draft 5

To determine the success of the SIIS on a subjective level, the project will conduct customer satisfaction surveys in Years 2 and 3 of the project for system end-users, including the clinic nurses and clerks and the parents of children. Clinic staff will be surveyed measure:

- ease of use of the system,
- system response time,
- value of reports, and
- reliability of the system and data, etc.

Parents of children served at the clinics will be surveyed to measure the effectiveness of reminders and confidence in the SIIS.

In addition to customer-satisfaction surveys, the TeleMed software will include a feature to monitor access to the system and automatically determine the number of “hits” or data queries, along with the number of data uploads over time. As information is uploaded to the system, TeleMed will also compare the dates that records were generated with the dates the records were received. For sites that will be accessing and entering information into the SIIS directly, we will be measuring time to complete data entry, based on initial access and final data elements entered.

Project Management

We will evaluate the effectiveness of our project-management scheme through periodic satisfaction surveys throughout Year 3. We are also teaming with the New Mexico Medical Review Association (NMMRA)—a nonprofit, physician-sponsored corporation that serves as the Peer Review Organization for New Mexico—to evaluate project management and overall project execution in terms of quality assurance.

The NMMRA will engage project participants in short-cycle, quality improvement activities related to the structure, process, and outcome of the SIIS and with the fit of the proposed infrastructure and necessary interfaces with individual project participant organization. The short-cycle, quality improvement activities are expected to lead to quick optimization of the public health information infrastructure and should hasten and deepen adoption of the information infrastructure by project participants.

The results of these short-cycle, quality improvement activities, summed over time, will constitute the overall evaluation of project execution and construction. The continuous quality feedback provided in these areas will allow us to make necessary changes or adjustments early in the project period. The development of our management structure and collaborative management style has been modeled after other successful collaborations and, more importantly, lessons learned in related projects.

VII. Plans for Growth of SIIS

STATEWIDE IMMUNIZATION INFORMATION SYSTEM: Business Plan: Draft 5

At the same time, this TeleMed/SIIS project brings together diverse partners from both the public and private sectors—including partners deploying a basic TeleMed system in rural Northern New Mexico; the sovereign Navajo Nation located in New Mexico, Arizona, and Utah; and potentially an international partner in the state's border area with Mexico—to test the feasibility of an international medical-information sharing. The up-front effort invested in the proposed solution has been enormous—from LANL's development work to years of building partners needed to support this project.

Plans for the growth of the SIIS will include linking it to UNM and to Lovelace as well as to others.

Outcomes and Assessment

Our progress in achieving project objectives will become visible as early as mid-way through Year 2. As the SIIS begins collecting automated data about the amount and quality of use, we can begin to estimate the associated impact on the immunization program. One of the overriding immunization objectives is to increase compliance with immunization guidelines. As early as Year 3, we should be able to measure improvements in immunization levels appropriate for age by comparing immunization dates with immunization guideline compliance.

Because N. M. Vital Records and Health Statistics is agreeing to enter children into the SIIS at birth, the project will be able to track immunization levels for approximately 96% of all newborn children in the state. This will provide immediate, and perhaps the most accurate feedback available in the program yet, about the success in immunizing children aged 0 to 36 months. This project will compare this information gained from the newborn registry to baseline information collected through CASA audits in each clinic. The state expects to achieve immunization rates for 24-month-old children who seek services in clinics to be at 90% by the year 2000.

Other outcomes that are indirectly related to our immunization objectives include a reduction in unnecessary immunizations and vaccine waste. While it is difficult to measure how frequently we over-immunize children due to disparate immunization records, we know it happens. Project participants administer some 80% of all immunizations given in the state. When we ensure that they have access to the complete immunization records of their patients, we also ensure that the patient will not be over-immunized.

An indirect way of measuring this would be to look at levels of vaccines administered. If our overall levels of immunizations are increasing while our vaccine inventory remains constant (or if it increases, but at a lower than expected rate), we could attribute the difference to a reduction in duplicate immunizations.

Though this measure is not critical to the success of our immunization program, we plan to examine it as a cost-saving measure. Also difficult to obtain direct measures for, but nonetheless the basic aim of any immunization program, is reducing the incidence of vaccine-preventable disease. As this is the ultimate result of a successful immunization

STATEWIDE IMMUNIZATION INFORMATION SYSTEM: Business Plan: Draft 5

program, we would expect to see this reduction appear in our integrated public health information system over long periods of time.

Technological Outcomes and Assessment

While the focus of the SIIS is to create a statewide, cross-provider immunization information systems of the technology behind the scenes is of great interest both to project partners and to medical informatics around the world.

In this project, we are deploying a unique technology that offers enormous benefits to the medical and public health community. The technology to implement it is far from simple and has resulted from years of expert development. We will be incorporating the latest standards and software available into the SIIS, and ultimately developing cutting-edge, international standards that will set the stage for immunization registries worldwide.

One of the crucial technical outcomes of the SIIS will be to take the advanced technology be developed as part of this project through the CORBAmed standardization process that includes evaluation, wide-scale testing, and a resulting commercial product. The end product more than just an immunization piece, but a module capable of plugging into a hardware concept, where computer users can expand their system capabilities by simply plugging the new feature into their computer hardware, medical information-sharing group developing the software “plug-n-play” equivalent. Just as TeleMed doesn’t require a certain database set up or computer platform to operate, rather a software adapter of sorts that plugs in their systems into a greater virtual network, so the other components of CORBAmed-approved medical information software will only require the proper interface to their functionality to a system.

By becoming a standard for immunization registries, the SIIS will have plug-n-play compatibility will with all other CORBAmed-developed software. The significance of that achievement cannot be overlooked. This standardization process will begin in Year 2, with a commercial development of the immunization software that comprises the SIIS beginning in Year 3.

VIII. Financial Requirements

It is expected that costs to connect offices of physicians to an SIIS should be similar to those to connect doctor’s offices to TeleMed. Paul Martinez of the NNM RTP estimates that it cost from \$3,000 to \$5,000 per site to connect to TeleMed.

Background

The elegance of the TeleMed solution to information management in the SIIS is its foundation on a distributed network. Throughout this Business Plan, numerous in-kind

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

contributions already have been made by partner organizations to help provide immunization data for a statewide system. These organizations plan to sustain their systems. They will maintain their own hardware, software, and Internet connections to the SIIS.

The NMDOH is prepared to maintain the PHD Integrated Information System, including the SIIS, once fully implemented. The PHD's Office of Information Management has five full-time systems analysts. Each of the four district offices has three full-time systems analysts (all will be used to help maintain the ISIS and SIIS). At least one of the State Office systems analysts will be reclassified into a database administrator to maintain the database. In addition, the Immunization Program within the Infectious Disease Bureau has one full-time systems analyst, a microcomputer operator, and three key-entry staff. These internal staff will be sufficient to maintain the TeleMed/SIIS.

The Office of Information Management (OIM) has an annual budget to keep the information-systems infrastructure up-to-date within the PHD on a five-year rotating basis. That is, over a five-year period, workstations, servers, and communication lines are upgraded, replacing the older, slower models with the newer faster ones; software is upgraded to the latest version of the standardized software in use throughout the division; and modems and communications infrastructure are upgraded.

Strategy

- capitalization needs
- funding sources, etc.
- projected operating expenses

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

Possible Nonprofit Foundation for SIIS

Although the NMDOH has a strong 70-year funding history within the state and may work with representatives to create a legislative avenue for sustainability (including the possibility of making immunizations reportable), project partners may look for alternative solutions to ensure long-term viability of the SIIS.

Project partners may consider other methods for continued system support, including the formation of a nonprofit foundation (dedicated to providing statewide immunization information and its supporting infrastructure) and a fee-based use of the SIIS by participant organizations. Since providers will carry associated costs of maintaining their own sites, maintenance costs will include keeping healthy systems operational. The NMDOH has already been charged with this maintenance effort.

Cost Benefits

- cost/benefit analysis

IX. Letters of Support

Letters of support for an SIIS have been obtained from:

- the Albuquerque Area Indian Health Service,
- the Border Health Office, Public Health Division, State of New Mexico Department of Health
- Health Centers of Northern New Mexico,
- Lovelace Health Systems,
- the New Mexico Chapter of the American Academy of Family Physicians Inc.,
- the New Mexico Health Policy Commission, State of New Mexico,
- New Mexico's Health Quality Improvement Organization,
- Northern New Mexico Community College
- Presbyterian Healthcare Services,
- the University of New Mexico, Health Sciences Center, and
- the University of New Mexico, Health Sciences Center, School of Medicine.

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

X. Action Plan

The Action Plan includes the following:

1. Get the NNM RTP up and running,
2. Link the NMDOH's data on VFC immunizations into its new information system,
3. Start the RPMS interface with TeleMed and link Presbyterian and IHS,
4. Begin the process to find a long-term organizational structure to maintain the SIIS, and
5. Create a committee to formulate SIIS policy standards.
6. Create a Marketing Plan to present to the CDC, the N.M. State Legislature, etc.
 - incorporate system with Public Health providers and VFC providers

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

Appendix

A-1: An Organizational View of the New Mexico Department of Health

The NMDOH has more than 4,200 state employees living and working in communities throughout the state. A Cabinet-level secretary, appointed by the governor, sets policy and direction. A deputy secretary for Administration oversees the Administrative Services Division, as well as several state-operated facilities providing inpatient services for long-term care, mental-health, and substance-abuse treatment. A deputy secretary for Programs oversees four divisions that include:

- Public Health,
- Behavior Health Services,
- Long-term Care Services, and
- the Scientific Laboratory.

A newly formed Division of Health Improvement oversees the department's quality assurance. The PHD of the NMDOH includes a structure under which state, district, and local public health office staff are managed and funded as state employees through a combination of federal grants and state general funds. The PHD is organized into five state-level, outcome-based program bureaus:

- 1 Family Health;
- 2 Chronic Disease Prevention and Control;
- 3 Injury, Violence, and Emergency Medical Services (EMS);
- 4 Infectious Disease Prevention and Control; and
- 5 Health Systems.

In addition, the Office of Epidemiology, the Office of Administration, the Office of Program Support, and the Office of Information Management (which includes N. M. Vital Records and Health Statistics) provide support services and surveillance activities. Four district offices—which divide the state into four quadrants—direct and manage 50 local public health offices (LHOs) statewide. The LHOs provide the gamut of public health services such as

- the prevention and control of HIV/AIDS, vaccine-preventable diseases, tuberculosis (TB), and sexually transmitted diseases;
- family planning and prenatal care;
- nutrition services for the Women, Infant, and Children (WIC) Program;
- community coordination around health issues;
- EMS;
- the prevention, early detection, and control of chronic diseases such as cancer, diabetes, and heart disease; and
- the assurance of access to basic medical-care services for children and persons with special healthcare needs.

STATEWIDE IMMUNIZATION INFORMATION SYSTEM: Business Plan: Draft 5

Also, there are 60 WIC Program-only mobile, part-time or contracted offices statewide.

The PHD's Integrated Information System Development Project: In the early 1990's, the PHD developed and implemented an interim electronic-data collection and reporting system for client-demographic information and services provided in its LHOs. Although the same software (called PHTURBO) is used throughout the state, each LHO maintains a separate client database. In addition, Children's Medical Services, HIV/AIDS, sexually transmitted diseases, the WIC Program, and other public health programs all maintain separate client databases—each collected on different software. Without easy access to this data statewide, the PHD is limited in its ability to utilize the data for statistical analyses and decision-making.

Aware of the lack of timely access to complete and useful public health information within New Mexico, the PHD initiated an Integrated Information System Development Project in 1994. The project includes three modules:

1. Client-based information,
2. Population-based information, and
3. Administrative information and processes.

An initial study and detailed report described a myriad of public health programs and separate databases throughout the PHD. Providing details about purposes, uses, and specific data elements collect, the report outlined a vision for an integrated-data system throughout the PHD.

By the year 2000, the PHD will have a fully operational, user friendly, integrated-information collection and reporting system in all state, district, and local offices, as well as fully trained public health staff. Those interested in public health information outside the division will be able to easily access up-to-date aggregated health information through the statewide Health Data System or learn where to get further health information. PHD staff will be able to readily transfer data at will in a secure environment, maintain confidential client-specific information, communicate with each other via E-mail, and electronically access, complete, and transfer a variety of administrative forms and tools.

Client-based Information: To further develop the Integrated Information System, the PHD contracted with Fox Systems Inc. to set forth functional requirements of all client-based programs except the WIC Program system. The client-based information-collection and reporting capability was named the Individual Services Information System (ISIS). ISIS will interface with WIC Program information in a seamless manner to users. ISIS includes the collecting and reporting of immunization information, as well as the other PHD public health programs' information, including the WIC Program.

A series of JAD sessions, held in 1997, obtained detailed information to develop functional requirements documents for the ISIS. SIIS stakeholders and more than 80 public health workers (in a variety of responsibilities such as clerks and public health physicians) from

STATEWIDE IMMUNIZATION INFORMATION SYSTEM: Business Plan: Draft 5

throughout New Mexico met to help define requirements. Functional requirements were submitted to the state 1997 in a document that included 46 public health programs either currently or seeking to maintain and report specific patient information in an integrated manner.

The state contracted with Fox Systems Inc. to work with the PHD to develop, issue, and evaluate the proposals received from a Request for Proposals RFP—utilizing the functional requirements recently developed—to purchase COTS software to collect and report demographic information and services provided by public health workers. The PHD has funds budgeted in State Fiscal Year 98 (July 1, 1997—June 30, 1998) to purchase much of this software. Fox Systems will assist the state in developing its Implementation Plan and serve as the Independent Validation and Verification contractor during implementation over the work provided by the selected software vendor.

Statewide Immunization Registry Efforts: As part of the Integrated Information System Development project, the State Office in Santa Fe for the last three years has been attempting to create a statewide database of demographic and shot-record information for people served within the 50 LHOs and by 303 additional VFC providers statewide. The information actually resides in many databases and can be entered:

- manually (key entry),
- diskette-based uploads, or
- communication-based uploads (tapes).

There is an attempt to identify duplicate records and consolidate them prior to entry into the statewide system.

Data-Standards Compliance: The consent form utilized by VFC providers includes all data standards set forth by federal regulation and CDC standards for immunization data collection. Nonpublic health providers send copies of all consent forms to the Immunization Program for key entry into the statewide database. Information collected on consent forms is entered into PHTURBO in each LHO. Downloads from PHTURBO are sent (via diskette) from each LHO on a quarterly basis.

Current Electronic-Transaction Methods: Until recently, the 303 nonpublic health VFC providers all completed a consent form for every person immunized and sent a copy of the form to the State Office for key entry into the statewide database.

To reduce paperwork for providers and eliminate duplicative key entry by the two state departments, the Immunization Program in June 1997 began receiving immunization data electronically (via tape) from the Medicaid fiscal agent for Medicaid-eligible children served by VFC providers. Providers no longer send copies of consent forms to the Immunization Program, but send billing information (via the HCFA 1500) to the Medicaid fiscal agent, who electronically sends the demographic and shot-record information to the Immunization Program. This information is uploaded into the statewide database. Due to a

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

lack of edits in the software, duplicate records are created, causing Immunization Program staff to locate and eliminate duplicates.

Data-Access Issues and Confidentiality of the Current System: Although nonpublic health office information is key-entered or electronically transferred into a single database, public health data is kept in a separate database for each quarter. A private contractor developed the software three years ago on a UNIX system in a language called PICK. Neither the UNIX system nor the PICK software are compatible with other programs in the PHD, as the rest of the division uses IBM-compatible personal computers and network servers running on Novell and Windows NT. There are few edits built into PICK software, resulting in many duplicate records within the database.

Recently, the contractor upgraded the server and converted the program from the old UNIX server to a Windows NT server utilizing MVBase software. This allows the state ad-hoc reporting capability previously unavailable. Aside from the incomplete communications infrastructure because data is located in several databases, it is impossible for providers to query and update a person's immunization records. Data is shared with individual providers on an "as requested" basis. All data is kept confidential. Because the information is not shared, VFC providers have few incentives to provide accurate and timely immunization data for a successful statewide system. Without enhancements to this current system, the methods for collecting data from VFC and other healthcare providers will continue to be labor-intensive and cumbersome, without providing participating healthcare providers any real benefits. In short, the current statewide immunization system, left untouched, will only be semi-successful.

Data Safeguards and System Security: Statewide immunization data is currently sorted on an NT server kept in a locked room and accessed only by authorized persons. The server is on the Immunization Program local area network and accessed only by people with authorized passwords that are changed frequently. The server is backed up nightly; tapes are kept offsite in the vault (also holding the N. M. Vital Records paper documents) located in another building with an electronic security system.

Communications Network Technology: The PHD historically has under-emphasized its infrastructure. Within the PHD infrastructure were pockets of relative poverty and wealth developed to meet organizational needs and often funded with categorical grant money. Since 1994, a four-year plan has been in place to improve the infrastructure and make the following changes:

- Desktop computers in state and district offices (as well as in the LHOs) have been increased and upgraded. Local area networks (with Category-5 wiring) and newer, faster file servers have been purchased and installed.
- The backbone of the wide area network (WAN) was put in place (including T-1 connections between the four district offices and state offices in Santa Fe) allowing easy movement of data.

STATEWIDE IMMUNIZATION INFORMATION SYSTEM: Business Plan: Draft 5

- E-mail and discussion-group technology utilizing Lotus Notes software has been implemented.
- Internet connections are available. Hardware has been purchased to connect (via 56-Kb lines) 23 LHOs to the frame relay WAN, to be fully implemented by mid-1998. The remaining LHOs will connect to the WAN through Federal Telecommunications Act funding for rural communities in mid-1998, thus completing the infrastructure for the state.
- Continuing funds from federal grant and general fund sources will be budgeted each year to keep the basic infrastructure fully operational.

**STATEWIDE IMMUNIZATION INFORMATION SYSTEM:
Business Plan: Draft 5**

A-2: Copy of New Mexico Medical Society Resolution

**B-203
A-98**

Introduced by: Steven Kanig, M.D., Albuquerque
Subject: Statewide Electronic Clinical Information System
Referred to: Reference Committee B

.....

- 1 WHEREAS We are presently wasting untold millions of dollars annually in
2 New Mexico in the following areas:
- 3 WHEREAS —Clinical data management, including the process of obtaining
4 copies of lab reports, radiology reports, physician dictation,
5 hospital records and other patient information in a timely fashion;
- 6 —Duplication of studies done when clinical data is not available in
7 an easily obtainable or timely fashion;
- 8 —Less than optimal cost effectiveness in clinical decision making
9 that could be amenable to better tools in the form of decision
10 support systems; and
- 11 WHEREAS The quality of health care delivery is adversely affected by
12 problems with timely and complete clinical data; and
- 13 WHEREAS There is great mobility in large populations amongst health plans,
14 necessitating changes in systems and physicians greatly
15 exacerbating the problems with clinical data management; and
- 16 WHEREAS New Mexico is a relatively poor state with limited resources, and
17 intense marketplace pressures to minimize health care costs; and
- 18 WHEREAS We have in New Mexico the tremendous advantage of a state-of-
19 the-art electronic medical record system being developed by the
20 Los Alamos National Laboratories (the “TeleMed” Project),
21 designed specifically to be able to link geographically dispersed
22 databases using Internet protocols; and

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

23 WHEREAS There is a sense of urgency brought about by the specter of various
24 health care organizations actively planning to purchase competing,
25 incompatible proprietary electronic medical records systems,
26 which would doom for the indefinite future any possibility of a
27 statewide system; therefore, be it

28 RESOLVED That the New Mexico Medical Society support the concept of the
29 development of a statewide electronic clinical information system;
30 and be it further

31 RESOLVED That the New Mexico Medical Society establish an ad hoc
32 committee for the development of a statewide electronic clinical
33 information system, with appropriately broad representation,
34 actively pursue the feasibility and possible implementation of such
 a system.

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

A-3: Description of Partners in SIIS

BlueCross BlueShield of New Mexico and HMONM

Through HMOHN, BlueCross BlueShield locally provides and manages a nonprofit healthcare company serving over 200,000 members and contracting with more than 3,000 providers.

Cimarron Managed Care Corp. and the UNMHSC

Currently, Cimarron Managed Care Corp. provides primary-care services throughout New Mexico. In Albuquerque alone, it serves more than 7,000 children in the pediatric emergency room of UNM Hospital and more than 40,000 children in the pediatric clinic. Cimarron Managed Care Corp.'s associates are the University of New Mexico, the University of New Mexico School of Medicine, and UNMHSC.

IHS

With its Navajo Area Office and its Albuquerque Area Office that have jurisdiction in New Mexico, IHS provides healthcare through a system of six hospitals, seven health centers, and 12 health stations to more than 200,000 members of the Navajo Nation in Arizona, Utah, and New Mexico. Its Albuquerque Area Office provides comprehensive health services to some 60,000 Native Americans living in 22 tribes in the state through a healthcare delivery system consisting of five hospitals and nine health centers.

LANL

One of the largest multidisciplinary, multi-program laboratories in the world, LANL has an Advanced Computing Laboratory promoting transfers of advanced-computing technologies into the private sector. It serves as a significant test-bed facility for advanced technologies. In addition, LANL is a leader in developing and using computational and information technologies.

Lovelace Health Systems

Comprised of New Mexico's oldest health maintenance organization (the Lovelace Health Plan), Lovelace Health Systems consists of a multi-physician group practice, a statewide contracted-physician network, and a complete healthcare delivery system. Lovelace has more than 300 physicians, who provide healthcare to 158,000 members statewide. In addition, Lovelace has six primary-care clinics and one hospital. In remote areas of the state, it contracts with local healthcare professionals to provide care to its members.

STATEWIDE IMMUNIZATION INFORMATION SYSTEM: Business Plan: Draft 5

the NMDOH

Including the Public Health Division (PHD) and Scientific Laboratory Division, the NMDOH has more than 1,000 employees in the PHD, which provides statewide public health clinical and laboratory services. In addition, the PHD works with community leaders to focus on and plan for community-health needs, performs surveillance for notifiable diseases, and organizes outbreak investigations. The public health infrastructure in New Mexico is centralized. The PHD has jurisdiction over all public health offices without competing local jurisdictions. Providing such services as immunizations, family planning, the WIC Program, HIV screening, and sexually transmitted disease diagnosis/treatment, the PHD includes 50 LHOs dispersed throughout all of the state's 33 counties. These offices are served by daily courier service to the Scientific Laboratory, a full-service, public health and environmental laboratory providing all of the PHD's routing and specialized laboratory testing. The Vital Records and Health Statistic section of the

process whereby 96% of all births in New Mexico are registered electronically. The Border Health Office, part of the PHD District Office in Las Cruces, provides epidemiological and environmental support for border health issues.

the NMMRA

A private, nonprofit physician-sponsored corporation, the NMMRA serves as the Peer Review Organization for New Mexico. The NMMRA conducts quality reviews for hospitals, Health Maintenance Organizations, the Albuquerque Area IHS, federally qualified health centers, and the PHD. It also implements collaborative quality improvement projects with these healthcare providers.

the NNM RTP

A three-year project funded by the National Telecommunication Information Act, the NNM RTP was formed to establish electronic patient-encounter records using TeleMed technology between 16 primary-care providers and two hospitals in Northern New Mexico. Initial deployment will focus on immunization records. Partners in that project include the Northern New Mexico Community College, Española Hospital, LANL, Los Alamos Medical Center, Las Clinicas del Norte, Health Centers of Northern New Mexico, and the NMDOH.

Presbyterian Healthcare Systems

Composed of eight acute-care hospitals throughout New Mexico, 16 primary-care clinics, Presbyterian Health Plan (with some 200,000 members), Presbyterian Home Healthcare (statewide), and Presbyterian Pickard Convalescent Center, Presbyterian Healthcare Systems has the largest tertiary-care hospital in the state. Besides its own health plan, Presbyterian has 91,000 registered children under age 18. Hepatitis B vaccine is administered to all newborns before leaving the hospital. Currently, Presbyterian

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

Healthcare Systems is developing clinical-information systems both in ambulatory and inpatient environments and has 120 affiliated physicians and 1,100 unaffiliated physicians who use its facilities.

St. Joseph Healthcare System

A fully integrated healthcare system, St. Joseph Healthcare System has five acute care hospitals, a physical rehabilitation hospital, and a physician network with facilities located throughout the greater Albuquerque area. St. Joseph Healthcare System has more than 900 physicians and 3,000 employees.

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

A-4. Immunization Information Retrieval in New Mexico

Demographics

Occupying a 121,660-square-mile area, New Mexico is the nation's 5th largest state—bigger than New England, New York, and New Jersey combined.

Currently, New Mexico

- is 47th in the United States in per capita income—with an income level 23% below the national average.
- ranks 36th in population—with 1.65 million people, as of 1995.
- numbers 42nd in population density—with an average density of 13.4 people per square mile.
- is predominantly a rural state—16 counties are rural (with 6 to 100 people per square mile) and 15 are frontier (with 6 or less people per square mile). Only Bernalillo and Los Alamos counties (2 of the state's 33 counties) are urban and have more than 100 people per square mile.
- was the 7th fastest growing state from 1990 to 1995.
- has an unemployment rate that is slightly higher than the national rate—1 in 5 lives below the federal poverty level, while the poverty rate is 46% for Native Americans, 27% for Hispanics, and 27% for Blacks.
- is the most culturally and ethnically diverse population of any state in the nation
 - 50% of the population is Caucasian,
 - 38% Hispanic,
 - nearly 9% Native American, and
 - 2% Black.

Native Americans are distributed among 20 Pueblos, while the Jicarilla and Mescalero Apache tribes, and 90,000 Navajos living within the state. There are 200,000 Navajos living in widely dispersed areas in New Mexico, Arizona, Colorado, and Utah.

The SIIS link between the IHS and the state will provide a rare opportunity to share medical information and likely lay the groundwork for other collaborative projects in such public health areas as disease surveillance and outbreak reporting.

New Mexico shares a border with Mexico and is experiencing a substantial increase in its population along the border due to immigration from Mexico. The border population of New Mexico consists of approximately 300,000 people living in six counties, which are all within 100 km of the U.S./Mexico border. Vaccination coverage levels among children aged 24-35 months in five of the six border counties were below the New Mexico vaccination-coverage level determined from a 1996-97 retrospective assessment.

STATEWIDE IMMUNIZATION INFORMATION SYSTEM: Business Plan: Draft 5

Each year, the state experiences a large influx of migrant laborers primarily from Mexico. Nearly 50,000 people work in the Texas/New Mexico border areas during certain harvest seasons. Notably, an estimated 60% to 70% of this migrant farm-worker population commutes daily from Juarez, Mexico. Because of inadequate access to medical records, the risk factors and medical histories of people within this population are largely unknown. Border states are concerned about disease outbreaks introduced from foreign visitors, who frequently have immunization levels differing from most Americans. The PHD Border Health Office (in conjunction with several sites in Juarez) may form a partnership to demonstrate among the first applications of international medical-records sharing over the Internet.

Meanwhile, the state's homeless population is continually growing. In 1995, the Albuquerque-based Health Care for the Homeless Inc. served 3,897 people. The homeless are primarily located in Albuquerque and are of great interest in overall public health because their lifestyle poses greater risks. Ironically, the homeless are also the most overlooked in healthcare and disease surveillance. The implementation of an SIIS can provide better immunization tracking for them.

STATEWIDE IMMUNIZATION INFORMATION SYSTEM:

Business Plan: Draft 5

A-5. SIIS Collaborative Efforts

Strengthening Existing Partnerships

One of the strongest elements of the TeleMed/SIIS project is the groundwork already formed for information sharing among a diverse set of partners. While the TeleMed technology has been under development for the last five years, the relationship among TeleMed/SIIS partners has been cultivated through a number of working groups over the last three years. A shared vision for statewide medical information-sharing led to collaborative partners—like LANL, Lovelace HealthSystems, Cimarron and the University of New Mexico Health Science Center (UNMHSC) and School of Medicine, Presbyterian Health Systems, and BlueCross BlueShield of New Mexico—to donate significant time to planning and demonstration projects to prepare for an opportunity such as the SIIS project.

Because of foundational efforts of groups—like the New Mexico Childhood Immunization Coalition, the Research Association of Medical and Biological Organizations (RAMBO), and the NNM RTP working group—project partners are well aware of the importance of a statewide immunization registry.

(See: www.acl.lanl.gov/RAMBO and www.TeleMed.nnm.cc.nm.us for details about ongoing collaborations.)

The SIIS project brings diverse partners from the public and private sectors—including partners deploying a basic TeleMed system in rural Northern New Mexico; the sovereign Navajo Nation located in New Mexico, Arizona, and Utah; and potentially an international partner in the state's border area with Mexico—to test the feasibility of international medical information sharing. The upfront effort invested has been enormous—from LANL's development to years building partners to support this project.

See Appendix for additional information on project partners.
